

ACTIVATION OF DRY CHARGED BATTERIES:

Remove all vent plugs and fill up with electrolyte (diluted sulphuric acid), density 1,27 kg/l (31 Bè, 36%), temperature $> 15^{\circ}$ C, to 10 ÷ 15 mm above the upper separator. After about 20 minutes check acid level and add electrolyte if required to reach the right level.

The battery is now ready for use; it is however advisable to recharge the battery for about 3 hours with current in (A) equal to 10% of the capacity (Ah), should the battery have been stored for a long period.

STARTER BATTERIES
